

Release Notes 4.15.14

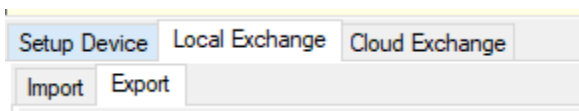

Devices Update

Local Exchange / Cloud Exchange

More and more manufacturers are introducing cloud (wireless) integration with their in-cab devices whilst still supporting local data exchange, for example via a USB stick.

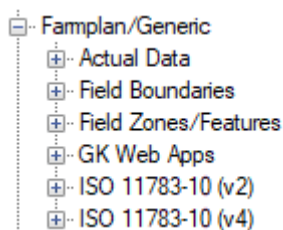

This update delivers a change in the user interface to simplify the process for sending and receiving data for devices with either cloud or local data exchange. Please note; these changes will only be visible for devices that currently support cloud data exchange.

Where Gatekeeper has integrated with a manufacturer's cloud integration, within the Devices window, in addition to the Setup Device tab, the user will be presented with two tabs, one for Local Exchange (for import and export to a USB stick) and another for Cloud Exchange (for connection via cloud integration).

ISO XML Version 4

Some manufacturers are adopting ISO XML Version 4 whilst others are still using ISO XML Version 2. You will now find 2 ISO XML versions (v2) and (v4) within the Farmplan/Generic node of Devices (see below);

It is not uncommon for manufacturers to be using Version 2 and Version 4 across their fleets. If you are unsure which version to use, check with your dealer or contact our support team on 01594 545022.

In addition, for the ISO XML file format we have;

Improved handling of tank mix spraying jobs.

Improved handling of the Implements and Tractor Units.

CNH Devices

Addition of the new CaseIH AFS Pro 1200 and the New Holland Intelliview 12 in-cab controller unit formats.
